Manuals and software are protected by copyright. All rights reserved. The copying, reproduction, translation, conversion into any electronic medium or machine scannable form is not permitted, either in whole or in part. The contents of the manual may not be disclosed by the recipient to any third party, without the prior written agreement of Hitachi Energy.

An exception is the preparation of a backup copy of the software for your own use. For devices with embedded software, the end-user license agreement provided with the software applies.

This document may not be used for any purposes except those specifically authorized by contract or otherwise in writing by Hitachi Energy.

Disclaimer

This document contains information about one or more Hitachi Energy products and may include a description of or a reference to one or more standards that may be generally relevant to the Hitachi Energy products. The presence of any such description of a standard or reference to a standard is not a representation that all the Hitachi Energy products referenced in this document support all the features of the described or referenced standard. In order to determine the specific features supported by a particular Hitachi Energy product, the reader should consult the product specifications for that Hitachi Energy product. In no event shall Hitachi Energy be liable for direct, indirect, special, incidental, or consequential damages of any nature or kind arising from the use of this document, nor shall Hitachi Energy be liable for incidental or consequential damages arising from the use of any software or hardware described in this document.

Hitachi Energy may have one or more patents or pending patent applications protecting the intellectual property in the Hitachi Energy products described in this document. The information in this document is subject to change without notice and should not be construed as a commitment by Hitachi Energy. Hitachi Energy assumes no responsibility for any errors that may appear in this document.

All people responsible for applying the equipment addressed in this manual must satisfy themselves that each intended application is suitable and acceptable, including compliance with any applicable safety or other operational requirements. Any risks in applications where a system failure and/or product failure would create a risk for harm to property or persons (including but not limited to personal injuries or death) shall be the sole responsibility of the person or entity applying the equipment, and those so responsible are hereby requested to ensure that all measures are taken to exclude or mitigate such risks.

Products described or referenced in this document are designed to be connected and to communicate information and data through network interfaces, which should be connected to a secure network. It is the sole responsibility of the system/product owner to provide and continuously ensure a secure connection between the product and the system network and/or any other networks that may be connected.

The system/product owners must establish and maintain appropriate measures, including, but not limited to, the installation of firewalls, application of authentication measures, encryption of data, installation of antivirus programs, and so on, to protect these products, the network, its system, and interfaces against security breaches, unauthorized access, interference, intrusion, leakage, and/or theft of data or information.

Hitachi Energy performs functionality testing on released products and updates. However, system/product owners are ultimately responsible for ensuring that any product updates or other major system updates (to include but not limited to code changes, configuration file changes, third-party software updates or patches, hardware change out, and so on) are compatible with the security measures implemented. The system/product owners must verify that the system and associated products function as expected in the environment in which they are deployed. Hitachi Energy and its affiliates are not liable for damages and/or losses related to security breaches, any unauthorized access, interference, intrusion, leakage, and/or theft of data or information.

This document and parts thereof must not be reproduced or copied without written permission from Hitachi Energy, and the contents thereof must not be imparted to a third party nor used for any unauthorized purpose.

 - 7.2 Document History 13

1 Preface

The usage for this document is to gather all symbols and graphical indicators in one place for easy reach for users of the new Web UI for FOXMAN-UN.

2 Entities - visual language

2.1 Device icon

Device icon is an icon that represents a single node in the network. It consists of three elements:

- 1 Service icon – visible only when a service is selected or pinned in right panel;
- 2 NE icon – representing a device on the visualized network map, content of which can be changed based on customers' icon library;
- 3 Name plate – scalable element containing the name of the device in client's network, set during creation of the NE element;

Table1 contains listed elements. More detailed states are presented in further sections.

NE icon	Service icon	Name plate
		<div style="border: 1px solid black; padding: 2px 10px; display: inline-block;">Ferrari</div>

Figure 1: Elements of device icon

2.2 States of device icon related to user actions

Different styling of this icon indicates the state a device can be in (Figure 2). There are 4 main states related to the user actions:

- Default – device in the network visible on a map. It indicates the absence of alarms;
- Inactive – device in the network that is not part of a service selected by the user on a map or in the entity browser;
- Non-manageable – NMS lost connection to this device and all data about this device may be obsolete;
- Disabled – the user cannot perform any actions on a disabled device;

All listed states can be in “selected” form if a user selects the device on the map or in the entity browser. A selected device does not equal a selected service.

Alarm states are described in section 3 Alarms (on page 8) of this document.

	Selected	Default	Inactive	Non-manageable	Disabled
No					
Yes					

Figure 2: Aggregated states of NE icon

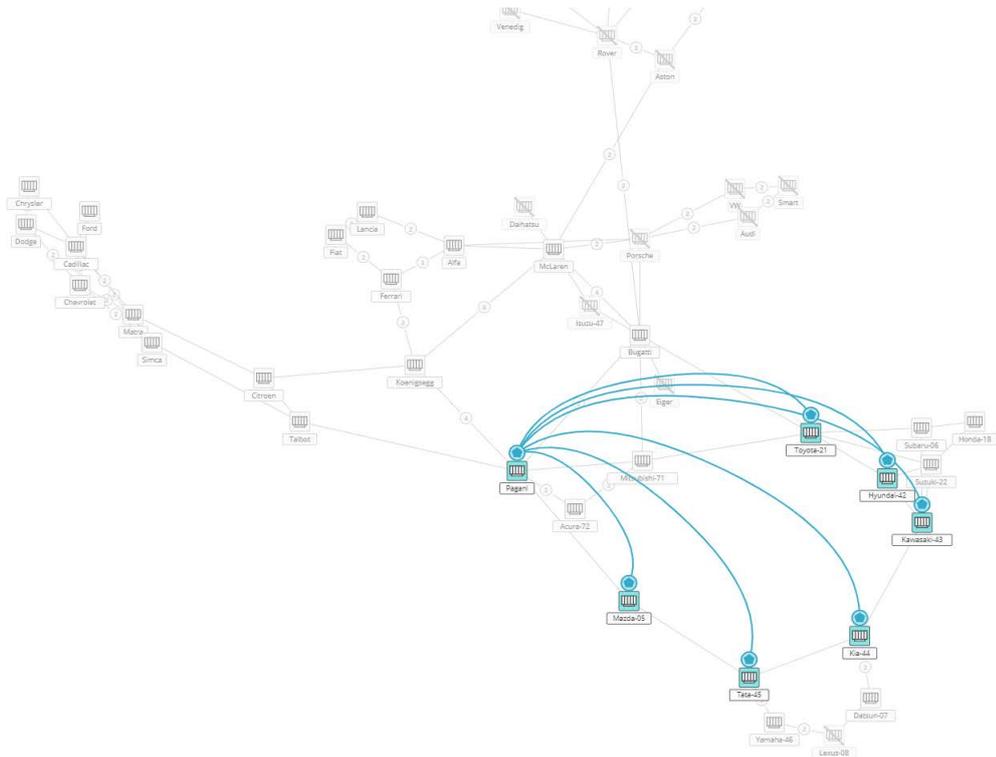

Figure 3: Service selected - example of all described states of device icon

2.3 Service icon

Service icon is an additional icon added on top of NE icon. It is only visible when a service is selected or if the previously selected service was pinned. It gives the user information about the role of VPLS node or numbers of services selected.

Hub on active device	Spoke on active device	PE - dual home on active device	E-Tree Root	E-Tree Leaf	Terminator	Initiator
Working/Protecting	2 services shared on 1 active device	3 services shared on 1 active device	Working	Counter	Protecting	

Figure 4: Service type, service role, number or protection type icons

2.3.1 Changing visibility

The visibility of each element in the device icon can be switched on or off based on user's preferences on network display. It can be performed from visibility options which can be accessed from "options" on the map in the top right corner.

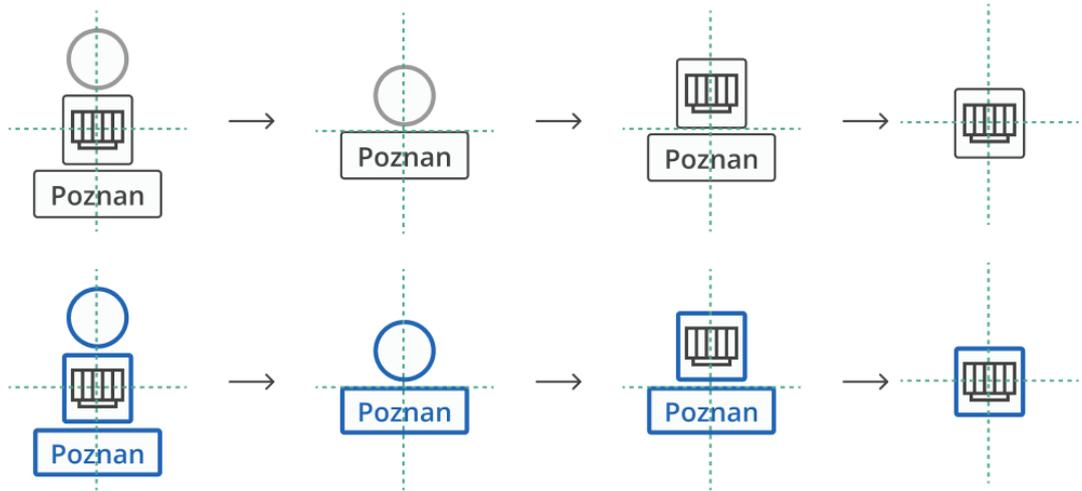

Figure 5: Behavior of icon when visibility of elements is changed

Additionally, next to NE icon can appear port indicator with amount of ports that are in particular device. Visibility of port amount can be switched on/off by the user in visibility options.

2.3.2 Port count

Port count icon is additional icon visible on NE icon. It displays the number of ports that are on the device. Its visibility can be switched off in Visibility Panel.

Empty port	Port count	Example of NE in active mode with visible port count	Example of NE in active mode with visible port count + selected service

Figure 6: Port count visible on device icon

2.4 Elements of a network

Symbols in default state are in transparent background. They indicate different elements of a network. They are used as supporting icons all around the application, e.g., in Ribbon, in View Modes, in Detail Page.

VPLS	VPWS	PW	Tunnel	Network Element	Section

Figure 7: Elements of a network

3 Alarms

Alarms are indicators of abnormal state on the device or service. There are four alarm indicators that categorize the alarms in terms of their importance: Critical, Major, Minor, Warning.

Critical	Major	Minor	Warning
			

Figure 8: Types of alarms

3.1 Alarms on device icon

Alarms can be visible on two parts of the device icon – NE icon and Service icon. The placement of alarm tells the user whether the alarm is on a logical or physical layer. To see all the alarms in the application users can access the Alarm Mode by clicking on Alarms in global header.

3.1.1 NE icon

NE icon not only indicates not only what kind of device it is but also if there are any problems with it. The visual problems icons and their meanings are aggregated in Figure 9.

All possible problems and alarms are presented in table4, based on state when none of the services are selected.

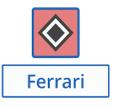

Selected	Critical alarm	Major alarm	Minor alarm	Warning alarm	Admin down	Operational down	Admin + Operational down
No							
Yes							

Figure 9: Aggregated problems indicators on NE icon

3.1.2 Service icon

Service icon also can indicate whether there is a problem with service. Different state of service icon can be combined with different NE icons. In case of many information that are connected to one service, the service icon goes into dynamic mode and will appear interchangeably. Potential problems that can be visualized on service icons are presented in Figure 10.

Selected	Critical Alarm on service	Critical alarm on service on indicator node	Critical alarm on service on terminator node	Critical alarm + counter
No				
Yes				

Figure 10: Aggregated potential problem indicators on service icon

4 Logical connections

“Logical connection” is a connection made by the user between devices in network that make service, transport, pseudowire or any connection that transport data in non-physical way. They are represented on a map in form of arch that goes from one service icon to another.

4.1 Services

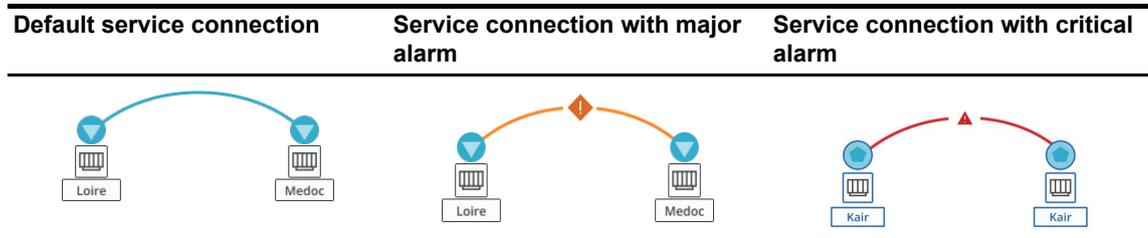

Figure 11: States of service

4.2 Transport connections

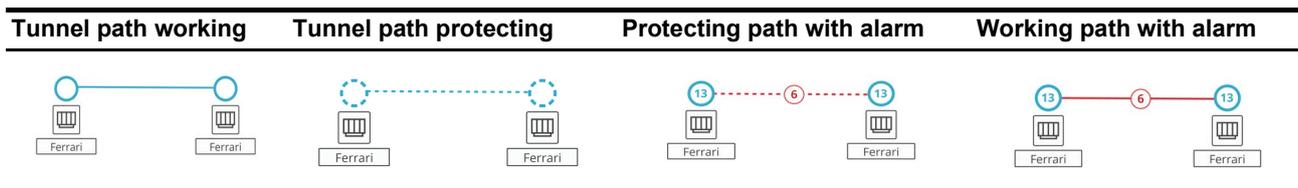

Figure 12: States of tunnel connections

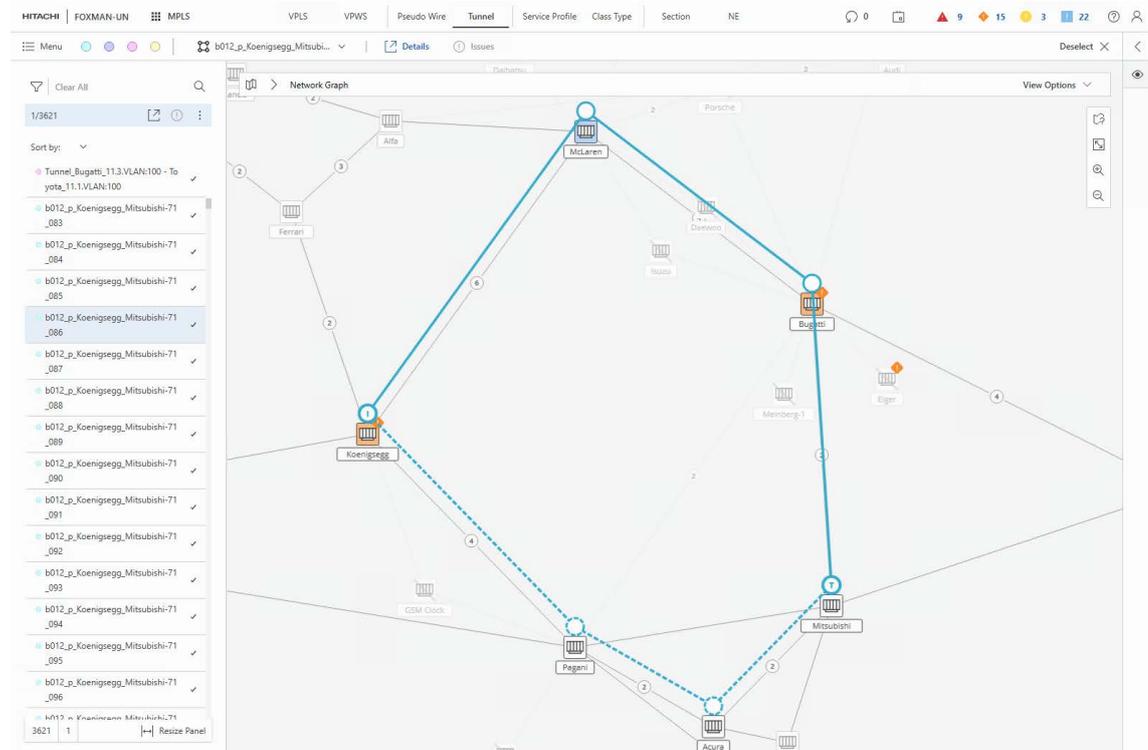

Figure 13: Example of selected tunnel (working and protecting path) on a map

5 Physical Connections

5.1 Physical Layer

Physical connections are connections between devices, e.g. cables. They are represented on a map in form of a line that connects two NE icons.

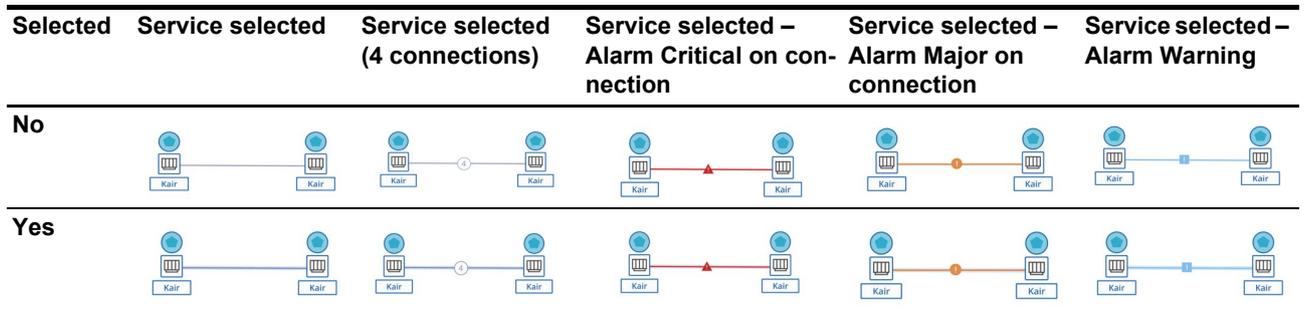

Figure 14: Physical connections

6 Time Synchronization Map

6.1 Symbols

Symbols in Time Synchronization Map tell the user about states related to clocks, e.g., operational modes or source.

6.1.1 Clock Operation Mode

Each symbol indicates a different operation mode, and based on their color the user can see if it is neutral or indicating an alarm (red color) as shown in Figure 15.

Phase Locked	Hold Over	Free Running	Frequency Locked	Acquiring	Unknown
					

Figure 15: PTP clock operation modes

6.1.2 Clock Source

Each clock source type has a separate icon. The significance of the icons is shown in Figure 16.

Other	Atomic	GPS	Terrestrial Radio	PTP	NTP	Handset	Internal Oscillator
							

Figure 16: PTP clock source types
